Notes

- Above rated loads are based on firm level ground, within 78% of tipping load at any point 360° throughout and with front stability of 1.15 or more.
- Working radius is horizontal distance from center of rotation to a vertical line through the centerline of gravity of the load.
- The weight of the hook block and other lifting devices must be considered to be a part of the load.
50 ton hook block·····0.49ton
25 ton hook block·····0.35ton
15 ton hook block·····0.31ton
- Crawler frame and A frame (high gantry) should also be extended before working.
- When jib boom is fitted actual loads that can be lifted with the main hook block should reduce following weights from the above chart (the weights include that of the auxiliary hook block).

Jib boom length(m)	1.00	6.00	9.00	12.00	15.00
Weight to be deducted(ton)	0.30	0.75	0.95	1.20	1.45

- Depending on the number of part lines, rated lifting load is limited as follows,
1-part line·····up to 5.8 tons
2-part line·····up to 11.4 tons
3-part line·····up to 16.0 tons
4-part line·····up to 20.0 tons
5-part line·····up to 25.0 tons
6-part line·····up to 30.0 tons
7-part line·····up to 35.0 tons
8-part line·····up to 40.0 tons
9-part line·····up to 45.0 tons
10-part line·····up to 50.0 tons
- The hook block will not come down to ground level, if the rope part line is more than shown in above chart.

Notes

- Above rated loads are based on firm level ground, within 78% of tipping load at any point 360 throughout with front stability of 1.15 or more.
- Working radius is horizontal distance from center of rotation to a vertical line through the center of gravity of the load.
- When main hook block installed actual loads that can be lifted with the jib hook should reduced following weights from the above chart.
50ton hook block.....0.49ton
25ton hook block.....0.35ton
15ton hook block.....0.31ton
5.8ton hook block.....0.12ton
- One part line jib hook lifting.
- Crawler frame and "A" frame should also be extended before working.
- Jib boom can only be used crane operations.
- Main boom can only be used for crane operations when equipped with 6.0m~15.0m jib.
- All rated loads are based on structural strength factors.
Make sure to prevent overloading.

Notes

1. The working radius is horizontal distance from center of rotation to vertical line through the center line of gravity of the load.
2. The weight of the hook block and other lifting devices must be considered to be a part of the load.
 50ton hook block.....0.49ton
 35ton hook block.....0.35ton
 15ton hook block.....0.31ton
 5.8ton hook block.....0.12ton
3. Do not exceed 3° of trim angle of pontoon on loaded condition.
4. Depending on the number of part lines, rated lifting is limited as follows.
 1-part line.....up to 5.8 tons
 2-part line.....up to 11.4 tons
 3-part line.....up to 15.0 tons
 4-part line.....up to 20.0 tons
 5-part line.....up to 25.0 tons
 6-part line.....up to 30.0 tons
 7-part line.....up to 35.0 tons
5. When 1 m jib installed, actual load that can be lifted with main hook block should be reduced 0.3 ton from above chart.
6. The 1 m jib lifting load should be reduced (0.3ton+main hook block weight) from above chart. However do not exceed 5.8tons.
7. Bucket operation can not be performed by 1 m jib.
8. Maximum boom length is 18m on bucket work.
9. The rated lifting load is 5ton on bucket work.
 Do not exceed 5ton for "bucket weight + load" during bucket work.
